RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 112 pages. Dimensions: 9.7in. x 7.4in. x 0.2in.This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1897 Excerpt: . . . Since the pull at the rim of the rope drum is 3, 400 pounds, when running at 200 feet per second, this motor would develop about twenty horse-power; and if the elevator had to act always at this speed, it would be sufficient to describe the motor as a twenty-horsepower motor; but this would give no information as to the ability of the motor to accelerate, since, at the moment of starting, the horse-power is nothing. Example 4. A four-pole railway generator, with the armature parallel connected (giving Pi), has 440 conductors on the armature, with 16. Ix100 lines per pole; the induction factor is seventy-seven, and the force factor for 600 amperes is 77x60046. 2 kilodynes; the output at 450 revolutions per minute is 46. 2x75 346 kilowatts; the dynamo is a General Electric Companys M. P. 4, 300 multipolar railway generator. Example 5. A ten-pole generator, armature parallel connected with 1, 440 conductors and 28. 6x10 lines per pole, will have an induction factor of 412. The force factor for 1, 500 amperes is 412x1, 500 618 kilodynes, and the output at eighty revolutions per minute is 825 kilowatts. The dynamo is a Westinghouse ten-pole railway generator. USE OK THE INDUCTION FACTOR IN DYNAMO CALCULATION SECTION III The induction factor forms a connecting link between the calculation for and the construction of a motor, and since it is the true basis of the dynamical action of the motor, it can be made the subject...
